A Game? Or a Reflection of a Deadly Reality?

It looks simple -- just keep every blip on your scope apart as you vector them around for approaches and departures. But they keep coming, pushing you to your limits. And you alone must prevent a dreaded crash between airliners loaded with passengers.

In this first ever microcomputer simulation of a Terminal Radar Approach Control facility created by a PhD ATC simulation expert, an FAA R&D manager, and professional controllers, you'll enter the inner sanctum of air traffic control.

Handle traffic on a "real" ATC radar scope. Adjust traffic loads from "no-sweat" midnight levels to a five-o'clock rush. Choose "lousy" pilots or "stormy" weather to test your skill with pilot errors and "go-arounds."

FAA insiders compare TRACON with million-dollar ATC trainers. It gives you a realistic traffic mix from Piper Cubs to Boeing 747 "heavies" in any of five control sectors: Los Angeles, San Francisco, Miami, Chicago, and Boston. Yet no experience is necessary: a detailed manual, sample scenarios, and an audio cassette demo tape train you in ATC procedures and jargon.

A Game? Hardly. TRACON mirrors a world where decisions determine not revenues or profits, but lives!

TRACON Macintosh Version

System Requirements

- Macintosh Plus or Later Model (incl. Mac II)
- 1 MB Random Access Memory
- 800K Floppy Disk Drive

Options

- Audio cassette tape player
