DOSReaDA

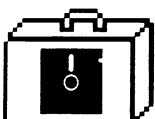

for the Apple™ Macintosh™

Software by C Port Limited

DOSReaDA allows files from diskettes written by MS-DOS on an IBM PC, or TOS on an Atari ST, to be copied into the Macintosh without using Apple File Exchange, or leaving whichever application you are working in. Files can be copied onto the Macintosh desktop, or onto the clipboard, ready for pasting into your documents.

Files can be copied into the Macintosh verbatim, or text files can have their line-feeds stripped automatically, with Control-Z (^Z) taken to mark the end of the file.

Text files can also have adjacent lines collected together to form paragraphs, which can be re-formatted by software on the Macintosh.

DOSReaDA is implemented as a Desk Accessory, and can be used by anyone who can open a file with a Macintosh.

This package contains a Macintosh format 3.5" disc, and an illustrated user's guide.

Completing and returning the registration card supplied with the program entitles you to one month of free telephone support.

Requires a Macintosh equipped with an FDHD "SuperDrive." A hard disk is recommended.
