False virus warnings:

Due to the special exe compression we are using in our products, some executable
files in the WinAce package may trigger virus alerts with some antivirus programs.
These tools will report different kinds of "trojan" or "generic" viruses.

In this case, it is a false alarm — as long as you downloaded WinAce from our site.
If you downloaded your evaluation version of our product from another website,
you should check the file length with the one given on our download page at
http://www.winace.com.

Please inform the developer of your antivirus toolkit about this false alarm
so that they can fix the detection routine in their next release.

Language selection:

If you have accidentally installed WinAce with the wrong language setting, you can
reselect the desired language by launching WinAce with the additional parameter PL
from the command line: WINACE.EXE PL <ENTER>
