- **Download latest Pegasus Prime app for Mac OS 7.5 CD-ROM** **v1.0** (1997-04-21)
  Users of Mac OS 8 or 9 do not require any special software updates to play. To avoid QuickTime version problems (described below), please do not use the installer from the CD-ROM and instead use the app from this Stuffit file to play the game. Pegasus Prime will also run fine under Mac OS X's Classic environment (version 10.2 to 10.4.11 recommended).

KNOWN BUGS: (unlikely to be fixed, since the CD-ROM version is no longer supported)

- If the Shield biochip is active when entering the shuttle at the Morimoto Mars Colony, this will cause the game to crash. Make sure to select any other biochip before entering the shuttle.

- Attempting to load a saved game during the middle of the Mars shuttle gameplay sequence will cause the system to crash.

- After successfully completing the retinal scan in NORAD, the cursor may still display a zoom icon. Clicking the zoom icon again (instead of walking forward) will repeat the retinal scan sequence, but otherwise does not affect gameplay.

- If the player already has an antidote during a return trip to the World Science Center, using it again will cause the player to be automatically moved in front of the replication device. However, normal gameplay can be resumed from this point.

- Pegasus Prime's installer application on the original 1997 CD-ROM has been known to automatically overwrite any installed version of QuickTime, even newer ones, with the old 1997 version (2.5). If you used the aforementioned installer directly from the CD-ROM, you may need to reinstall a newer version of QuickTime (4.0.3 / 5.0.5 / 6.0.3). Mac OS 9 users can just use the Software Update control panel to download the latest compatible version of QuickTime directly from Apple.

- Mac OS 7.5.x users experiencing problems with Pegasus Prime's automatic resolution switching can try downloading DrawSprocket version 1.1.2 and just replace the DrawSprocketLib in your system folder with the newer version (you don't even need to restart). Apple also offers DrawSprocket version 1.7.5 for users of Mac OS 8.1 to 9.2.2 (download from links at bottom of page instead of the right side, but it's only needed if your installed system does not already come with it).

- You may experience delays or pauses during gameplay if the program is loading data from slower CD-ROM drives on computers below minimum requirements. It is highly recommended that you view the manual and README file for further information on optimizing system performance.

- The hand cursor may disappear after clicking on an active object, such as a selection on an in-game screen or device. By simply moving the mouse around, the cursor should reappear.

- On USB-equipped systems with compact keyboards (such as PowerBooks) that are running Mac OS 8 or 9, the game may freeze when attempting to bring up the biochip or inventory tray. Plugging in a full-size keyboard or playing the game from within the Mac OS X Classic environment will avoid this problem.

- Users of the SheepShaver emulator may have problems accessing the inventory panel in Pegasus Prime because the upper-left tilde (`) key defaults to European configuration (§), even on North American keyboards. Download the keycodes fix Stuffit or ZIP file. Then, under SheepShaver's miscellaneous preferences, click "Use Raw Keycodes" and select the downloaded keycodes-tilde-fix file to properly remap the keys.
