- Why InterActual Player Uses Internet Explorer

System Requirements

- Mac OS X version 10.2 "Jaguar" only. More recent versions of Mac OS X will require an update. Please visit <http://support.interactual.com> for information on updates.
- Power Mac G3 or G4, iMac, eMac, PowerBook G3 or G4, or iBook computer with 128MB of physical RAM.
- A DVD-ROM equipped Macintosh with built-in FireWire.
- Microsoft Internet Explorer for Mac OS X (5.2 or higher).
- Please note: external DVD drives, the original PowerBook G3 and processor upgrade cards are not supported.

Running InterActual Player

When you insert a DVD into a Macintosh, the Apple DVD player will launch. Please close the DVD player and double click the icon for the DVD disc on the desktop. The installer for the InterActual Player is included on the DVD as a single file, called "IAPlayer.dmg". To install, double click this file, and click "Agree" after you have reviewed the software license agreement. This creates a new volume on the Apple desktop, called "InterActual_Player". Double click this volume to open it and drag the InterActual Player icon to a convenient location in your system (for example: the Applications folder or the Desktop). Double click the InterActual Player icon to launch the software.

Technical Support

If you encounter any difficulties with the DVD-ROM content on this InterActual DVD-ROM, please visit our online support page at <http://support.interactual.com>.

Why InterActual Player Uses Internet Explorer

For some features InterActual Player requires and launches the Internet Explorer browser that is shipped with your computer in order to access the enhanced and interactive DVD content. This is due in part to some of the functionality that the InterActual Player relies upon which is not universally supported with all web browsers.
