commandline dearchiver UNACEv2.5, Copyright ACE
Compression Software

This image contains these files:

- * unace25.pkg – Mac OS X package, containing the unace executable
- * Readme.txt – this file

Description

unace 2.5 for Mac OS X is a port of the commandline tool unace, which is the uncompressing part of the excellent (but yet) closed source windows compression software WinACE. Its hard to beat compression results made it the preferred tool of many people on the net.

After the port to x86 Linux now unace is finally available for Mac OS X and possibly other big endian plattforms!

Installation

To get unace installed, use the provided installer package named “unace25.pkg”. The installer is pretty safe to use. It will not touch your system files, but simply put the unace executable in your /usr/local/bin directory.

Configuration

To use unace from inside the Terminal, the /usr/local/bin directory has to be part of your shell path. If its not, follow this instructions:

For csh/tcsh add this line to the end of your .cshrc or .tcshrc file:

```
set path = ($path /usr/local/bin)
```

For sh/bash add this line to the end of your .profile file

```
PATH="$PATH:/usr/local/bin"
```

Have fun! (Kolja Koischwitz)
